

Keyline Technologies — Project Apollo

Classification: PROJECT CONFIDENTIAL • Access: Apollo Project Members

1. Project Overview

- Project Apollo is an internal knowledge-search platform that allows authorized employees to search company documents using natural-language questions.
- The platform uses retrieval-augmented generation (RAG) to retrieve relevant document passages before generating an answer.

2. Project Objective

- Provide fast document search while ensuring users only receive information permitted by their tenant, role, and document permissions.
- Reduce time spent manually searching large collections of internal documents.

3. Technology

- Frontend: HTML, CSS, JavaScript.
- Backend: Python with a web API.
- Retrieval layer: vector-based semantic search.
- Generation layer: configurable large language model provider.

4. Team

- Project Owner: Aisha Rahman.
- Backend Lead: Daniel Kumar.
- Security Lead: Priya Menon.
- UI Lead: Arjun Shah.

5. Current Status

- Authentication and basic document retrieval are operational.
- Permission-aware filtering is implemented before retrieved passages are provided to the answer-generation layer.
- The team is currently testing cross-document retrieval and unauthorized-access scenarios.

Demo dataset for the Keyline permission-aware RAG project. All names, figures, and company information are fictional.
